PROFESSIONAL SUMMARY

Computer Science undergraduate currently working as a Data Science Intern at Celebal Technologies, building regression, forecasting, and deep learning models on real-world data. Has independently built and deployed two full-stack ML projects — a computer vision deepfake detector and an NLP sentiment classifier achieving 98% accuracy — both live and open-source on GitHub.

EDUCATION

DIT University, Dehradun, Uttarakhand Aug 2023 – May 2027
B.Tech in Computer Science and Engineering | CGPA: 7.4

Kendriya Vidyalaya No. 1, Roorkee, Uttarakhand 2020 – 2023
Senior Secondary Education (Class XII: 74.25%, Class X: 85.16%)

EXPERIENCE

Data Science Intern — Celebal Technologies Jun 2026 – Present · Remote

- Forecasted Tesla vehicle deliveries by building and comparing Linear Regression, Random Forest, and ARIMA models, improving prediction reliability through GridSearchCV tuning and MAE/RMSE/R-squared evaluation.
- Segmented countries by socio-economic profile using K-Means and DBSCAN, then validated groupings with supervised classifiers (Decision Tree, Random Forest, XGBoost) and visualized separability via PCA, Elbow Method, and Silhouette Score.
- Compared ANN and CNN architectures on the CIFAR-10 image classification task, demonstrating measurable accuracy gains from convolutional feature extraction over fully-connected layers.
- Applied statistical foundations (hypothesis testing, CLT, Bayes' theorem, PSI) to strengthen real-world data analysis and model evaluation workflows.

PROJECTS

Deepfake Image Detector TensorFlow, MobileNetV2, Streamlit
[GitHub](#) | [Live Demo](#)

- Built a binary real-vs-deepfake image classifier using transfer learning on a frozen, ImageNet-pretrained MobileNetV2 backbone.
- Chose MobileNetV2 over training from scratch to keep the pipeline lightweight and fully CPU-trainable, preserving strong feature quality without GPU access.
- Deployed the trained model as a live, interactive Streamlit web app supporting real-time image upload with real/fake prediction and confidence score.

Sentiment Analysis — Bi-LSTM & Transformer Benchmark TensorFlow, NLP, Bi-LSTM
[GitHub](#) | [Live Demo](#)

- Built a Bidirectional LSTM model to classify ~61,000+ tweets into Positive, Negative, or Neutral sentiment using the Twitter Entity Sentiment dataset.
- Achieved 98% accuracy and a 0.98 macro F1-score on the validation set (828 samples), with balanced precision/recall across all three classes.
- Benchmarked the trained model against a pretrained RoBERTa transformer (zero-shot) to compare domain-specific vs. general-purpose language understanding on negation and contextual sentiment.
- Deployed the model as a live Streamlit app for real-time sentiment prediction on user-entered text.

TECHNICAL SKILLS

Languages: Python, SQL

ML / DL: TensorFlow, Keras, PyTorch, Scikit-learn, NumPy, Pandas

Tools: Git, GitHub, Streamlit, Jupyter, VS Code, MySQL

Coding Practice: 250+ problems solved on LeetCode (Python, Java, MySQL, Pandas)

CERTIFICATIONS

- Python (Basic)** — HackerRank · Issued Dec 2025
- Supervised Machine Learning: Regression and Classification** — DeepLearning.AI · Issued Jun 2026
- Advanced Learning Algorithms** — DeepLearning.AI · Issued Jul 2026
